

Mobile noise generator

MODEL

MNG-300 "Rabblor" Edition

User Manual

Introduction

Thank you for selecting this new protective device, the MNG-300 "Rabblor" Edition. This new product was designed by TSCM/countersurveillance professionals and will protect you against all types of eavesdropping when used in correspondence with the recommendations.

The "Rabblor" employs a new approach to the problem of conversation protection. It uses a new, speech-like noise which, in the most of cases, has proven to be more efficient when compared to white noise.

The speech-like noise in the MNG-300 "Rabblor" has been 'compiled' using real human conversations and is similar to the noise of a 'rabble' in busy public places. This type of noise is the most effective when creating interference to voice recorders and listening devices, especially when the size of the protective device is critical. The MNG-300 "Rabblor" Edition is a portable, cigarette-pack sized device which can easily be transported in a pocket or a small bag.

The MNG-300 "Rabblor" has been specifically designed for situations when the safety of conversations is extremely important on the one hand, and on the other hand the protective device should be as small as possible to allow easy transportation while not giving away your intentions. As the Rabblor is always nearby, it can easily be taken out and used anytime with the slightest chance of any information leakage.

Kinds of listening devices rendered useless by the new MNG-300 "Rabblor" Edition:

- Voice recorders
- Radio microphones
- GSM/3G "bugs"
- Body-carried video cameras watches, ties, etc. (jamming of acoustics)
- Wired microphones
- Any other type of audio surveillance
